

Has anyone had experience with the "new" ETEK motor? I understand that it is an AC as opposed to the old DC ETEK. I've looked at some of the suggested alternatives such as the PERM, but the prices get pretty darn high. Of course there's EBay, but I worry about the quality and condition. If anyone has some suggestions I'm all ears.

Electricmotorsport.com has a complete kit. They're selling them for outboard motors on sailboats. No one has run one yet because their new and most teams still have the old Eteks. Would be an interesting race to see how it stack up against the old ones.

I know you've seen it Joe, but others may have not. Iowa Electrathon has a good video on-line concerning the AC Etek and DC motor in general.

While doing some web surfing I came across this knock-off motor. It claims to be a suitable replacement for the ETEK motor; however, I am not sure who actually manufactures it. It seems too pricey and I have not compared the specs.
